| 7 | <ul style="list-style-type: none"> a. To Study about Yet Another Compiler-Compiler(YACC). b. Create Yacc and Lex specification files to recognizes arithmetic expressions involving +, -, * and / . c. Create Yacc and Lex specification files are used to generate a calculator which accepts integer type arguments. d. Create Yacc and Lex specification files are used to convert infix expression to postfix expression. |

Practical – 1

AIM a: Write a program to recognize strings starts with 'a' over {a, b}.

PROGRAM CODE:

```
#include <stdio.h>
#include <stdlib.h>
void main()
{
    int n, i = 0, state = 0;
    printf("Enter the length of the string: ");
    scanf("%d", &n);
    char input[n];
    printf("Enter the string: ");
    scanf("%s", &input);
    while (input[i] != '\0')
    {
        switch (state)
        {
            case 0:
                if (input[i] == 'a')
                {
                    state = 1;
                }
                else if (input[i] == 'b')
                {
                    state = 2;
                }
                else
                {
                    state = 3;
                    break;
                }
            case 1:
                if (input[i] == 'a' || input[i] == 'b')
                {
                    state = 1;
                }
                else
                {
                    state = 3;
                    break;
                }
            case 2:
                if (input[i] == 'a' || input[i] == 'b')
                {
                    state = 2;
                }
                else
                {
                    state = 3;
                    break;
                }
            case 3:
                break;
        }
        i++;
    }
}
```

```
else
state = 3;
break;
case 2:
if (input[i] == 'a' || input[i] == 'b')
state = 2;
else
state = 3;
break;
case 3:
state = 3;

break;
}
i++;
}
if (state == 0 || state == 2)
{
printf("String is invalid");
}
else if (state == 1)
{
printf("String is valid");
}
else
printf("String is not recognized");
}
```

OUTPUT:

```
Enter the length of the string: 4
Enter the string: aabb
String is valid
```

AIM b: Write a program to recognize strings end with 'a'.

PROGRAM CODE:

```
#include <stdio.h>
#include <stdlib.h>
void main()
{
    int n, i = 0, state = 0;
    printf("Enter the length of the string: ");
    scanf("%d", &n);
    char input[n];
    printf("Enter the string: ");
    scanf("%s", &input);
    while (input[i] != '\0')
    {
        switch (state)
        {
            case 0:
                if (input[i] == 'a')
                {
                    state = 1;
                }
                else
                {
                    state = 0;
                }
                break;
            case 1:
                if (input[i] == 'a')
                {
                    state = 1;
                }
                else
                {

```

```
state = 0;  
}  
break;  
}  
i++;  
}
```

```
if (state == 0)
{
printf("String is invalid");
}
else if (state == 1)
{
printf("String is valid");
}
}
```

OUTPUT:

```
Enter the length of the string: 4
Enter the string: aabb
String is invalid
```

AIM c: Write a program to recognize strings end with 'ab'. Take the input from text file.

PROGRAM CODE:

```
#include <stdio.h>

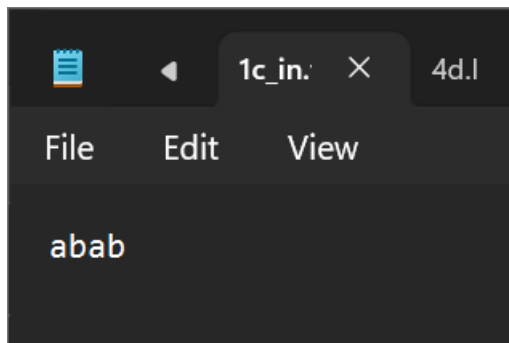

void main()
{
    int state = 0, i = 0;
    FILE *fptr;
    fptr = fopen("1c_in.txt", "r");
    char input[100];
    fgets(input, 100, fptr);
    printf("Input string: %s", input);
    fclose(fptr);
    while (input[i] != '\0')
    {
        switch (state)
        {
            case 0:
                if (input[i] == 'a')
                {
                    state = 1;
                }
                else
                {
                    state = 0;
                }
                break;
            case 1:
                if (input[i] == 'b')
                {
                    state = 2;

case 2:
if (input[i] == 'a')
{
state = 1;
}
else
{
state = 0;
}
break;
}
i++;
}
if (state == 2)
{
printf("\nString is valid");
}
else
{
printf("\nString is invalid");
}
}
```

INPUT File:

**OUTPUT:**

```
Input string: abab
String is valid
D:\NUV\CD\LAB>
```

AIM d: Write a program to recognize strings contains 'ab'. Take the input from text file.

PROGRAM CODE:

```
#include <stdio.h>

void main()
{
    int state = 0, i = 0;
    FILE *fptr;
    fptr = fopen("1c_in.txt", "r");
    char input[100];
    fgets(input, 100, fptr);
    printf("Input string: %s", input);
    fclose(fptr);
    while (input[i] != '\0')
    {
        switch (state)
        {
            case 0:
                if (input[i] == 'a')
                {
                    state = 1;
                }
                else
                {
                    state = 0;

}  
break;  
  
case 2:  
state = 2;  
break;  
}  
i++;  
}  
if (state == 2)  
{  
printf("\nString is valid");  
}  
else  
{  
printf("\nString is invalid");  
}  
}
```

INPUT File:**OUTPUT:**

```
Input string: abab  
String is valid
```

Practical – 2

AIM a: Write a program to recognize the valid identifiers.

PROGRAM CODE:

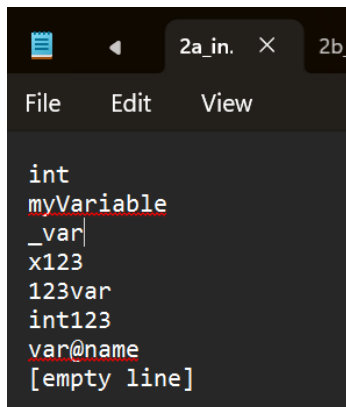

```
#include <stdio.h>
#include <stdlib.h>
#include <ctype.h>
void main()
{
    int state = 0, i = 0;
    FILE *fptr;
    fptr = fopen("2a_in.txt", "r");
    char input[100];
    while (fgets(input, 100, fptr) != NULL)
    {
        printf("Input string: %s", input);
        i = 0;
        state = 0;
        while (input[i] != '\0' && input[i] != '\n')
        {
            switch (state)
            {
                case 0:
                    if (input[i] == 'i')
                    {
                        state = 1;
                    }
                    else if (input[i] == '_' || isalpha(input[i]))
                    {
                        state = 4;
                    }
                    else
                    {

```

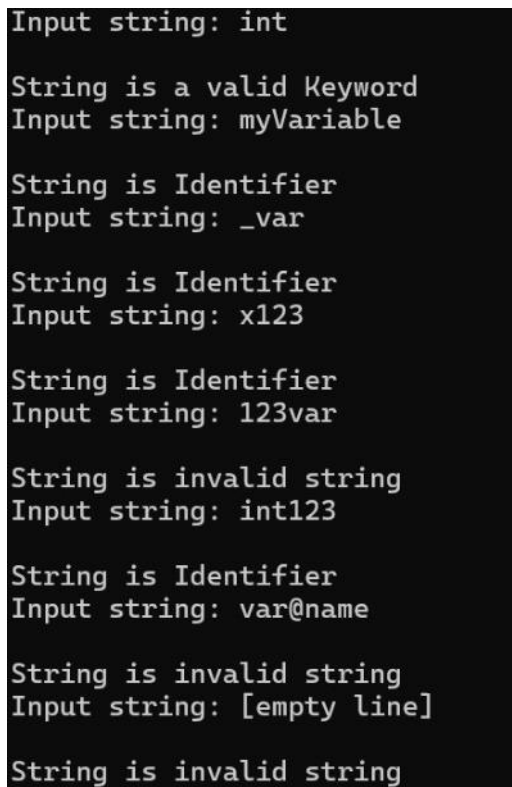

```
state = 5;
}
break;
case 1:
if (input[i] == 'n')
{
state = 2;
}
else if (input[i] == '_' || isalpha(input[i]))
{
state = 4;
}
else
{
state = 5;
}
break;
case 2:
if (input[i] == 't')
{
state = 3;
}
else if (input[i] == '_' || isalpha(input[i]))
{
state = 4;
}
else
{
state = 5;
}
break;
case 3:
if (isalpha(input[i]) || isdigit(input[i]) || input[i] == '_')
```

```
{
state = 4;
}
else
{
state = 5;
}
break;
case 4:
if (isalpha(input[i]) || isdigit(input[i]) || input[i] == '_')
{
state = 4;
}
else
{
state = 5;
}
break;
}
i++;
}
if (state == 4)
{
printf("\nString is Identifier\n");
}
else if (state == 3)
{
printf("\nString is a valid Keyword\n");
}
else if (state == 5)
{
printf("\nString is invalid string\n");
}
```

```
else
{
printf("\nString is empty\n");
}
}
fclose(fptr);
}
```

INPUT File:A screenshot of a text editor window with a dark theme. The window has two tabs: '2a_in.' and '2b_'. The '2a_in.' tab is active, showing a list of input strings: 'int', 'myVariable', '_var', 'x123', '123var', 'int123', 'var@name', and '[empty line]'. The strings are listed one per line. The 'int' and 'myVariable' strings are underlined in red. The window has a menu bar with 'File', 'Edit', and 'View' options.

```
int
myVariable
_var
x123
123var
int123
var@name
[empty line]
```

OUTPUT:A screenshot of a terminal window with a black background and white text. It shows the output of a program that checks if input strings are valid keywords, identifiers, or invalid strings. The output is as follows:

```
Input string: int
String is a valid Keyword
Input string: myVariable
String is Identifier
Input string: _var
String is Identifier
Input string: x123
String is Identifier
Input string: 123var
String is invalid string
Input string: int123
String is Identifier
Input string: var@name
String is invalid string
Input string: [empty line]
String is invalid string
```

AIM b: Write a program to recognize the valid operators.

PROGRAM CODE:

```
#include <stdio.h>

int main()
{
    char input[100];

}
```

INPUT File:A screenshot of a text editor window with a dark background. The title bar at the top shows a blue icon, a left arrow, the text '2c_in.', and a close button. Below the title bar are three menu items: 'File', 'Edit', and 'View'. The main text area contains a list of numbers, each on a new line: '123', '456.789', '-123', '+456.78e5', '3.14159', '2e10', '1.23E-4', and '-3.14e+2'.

```
123
456.789
-123
+456.78e5
3.14159
2e10
1.23E-4
-3.14e+2
```

OUTPUT:A screenshot of a terminal window with a black background and white text. It displays eight lines of output, each corresponding to an input from the file. Each line starts with 'The input' followed by the number, then 'is a valid' followed by the category (integer, floating-point number, or scientific notation number), and ends with a period.

```
The input 123 is a valid integer.
The input 456.789 is a valid floating-point number.
The input -123 is a valid integer.
The input +456.78e5 is a valid scientific notation number.
The input 3.14159 is a valid floating-point number.
The input 2e10 is a valid scientific notation number.
The input 1.23E-4 is a valid scientific notation number.
The input -3.14e+2 is a valid scientific notation number.
```

AIM d: Write a program to recognize the valid comments.

PROGRAM CODE:

```
#include <stdio.h>

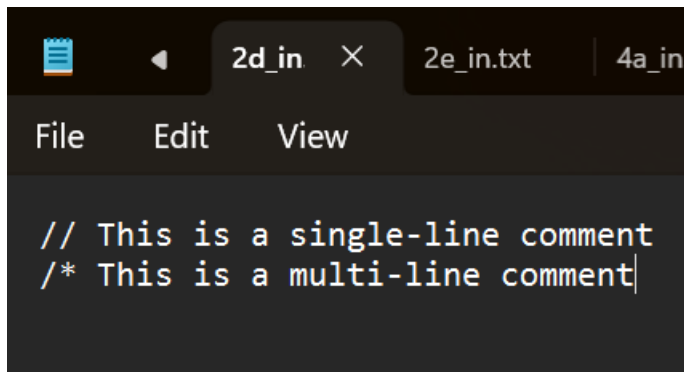

void main() {
    int state = 0, i = 0;
    FILE *fptr;
    fptr = fopen("2d_in.txt", "r");
    // Read input from the file
    char input[100];
    fgets(input, 100, fptr);
    printf("Input string: %s", input);
    fclose(fptr);

    // State machine to detect comments
    while (input[i] != '\0') {
        switch (state) {
            case 0:
                if (input[i] == '/') {

AIM: To Study about Lexical Analyser Generator (LEX) and Flex(Fast Lexical Analyser)

What is a Lexical Analyzer Generator?

A Lexical Analyzer Generator is a tool that automates the creation of a Lexical Analyzer (lexer), which is the first phase of a compiler. Its job is to scan the source code and convert it into a stream of tokens—the basic building blocks like keywords, operators, identifiers, etc.

What is LEX?

LEX (short for Lexical Analyzer Generator) was one of the earliest tools developed to help create lexical analyzers. It uses regular expressions to specify token patterns and generates C code that recognizes these patterns.

- Developed in the 1970s as part of the Unix toolchain.
- Usually used with Yacc (Yet Another Compiler Compiler) for syntax analysis.

Structure of a LEX program:

```
% {  
// C declarations  
% }  
%%  
[0-9]+ { printf("NUMBER\n"); }  
[a-zA-Z]+ { printf("WORD\n"); }  
. { printf("UNKNOWN\n"); }  
%%  
int main() {  
yylex();  
return 0;  
}
```

What is Flex?

Flex (Fast Lexical Analyzer Generator) is a free and faster alternative to LEX, and it is more commonly used today.

- Flex is open-source and generates more efficient code.
- It is backward-compatible with LEX but offers extra features and optimizations.
- It produces a C source file (e.g., lex.yy.c) which can be compiled with GCC.

Advantages of Flex over LEX:

| Feature | LEX | Flex |
|-------------|----------------|------------------------|
| Speed | Slower | Faster |
| Portability | Unix-only | Cross-platform (POSIX) |
| Extensions | Limited | More modern extensions |
| Output Code | Less optimized | Highly optimized |

How It Works

1. Input: Regular expressions and actions (C code) for each pattern.
2. Processing: Generates a C program (lex.yy.c) that uses a finite state machine (DFA).
3. Output: The compiled lexer reads input, matches patterns, and executes associated actions.

Use Cases

- Programming language compilers (e.g., C, Python).
- Interpreters.
- Code analyzers or format checkers.
- Custom parsers in domain-specific languages.

Practical – 4

AIM a: Write a Lex program to take input from text file and count no of characters, no. of lines & no. of words.

PROGRAM CODE:

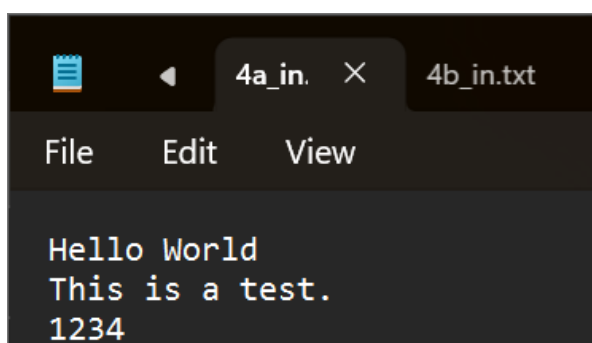

```
% {
#include<stdio.h>
int l=0, w=0, c=0;
int in_word=0;
% }
%%

[a-zA-Z] { c++; in_word = 1; }
\n { l++; if (in_word) { w++; in_word=0; } }
[ \t]+ { if (in_word) { w++; in_word=0; } }
. { if (in_word) { w++; in_word = 0; } }
%%

void main() {
yyin = fopen("4a_in.txt", "r");
yylex();
printf("Number of characters: %d \nNumber of lines: %d \nNumber of words: %d", c, l, w);
}

int yywrap() {
return (1);
}
```

INPUT File:

OUTPUT:

```
Number of characters: 21  
Number of lines: 3  
Number of words: 6
```

AIM b: Write a Lex program to take input from text file and count number of vowels and consonants.

PROGRAM CODE:

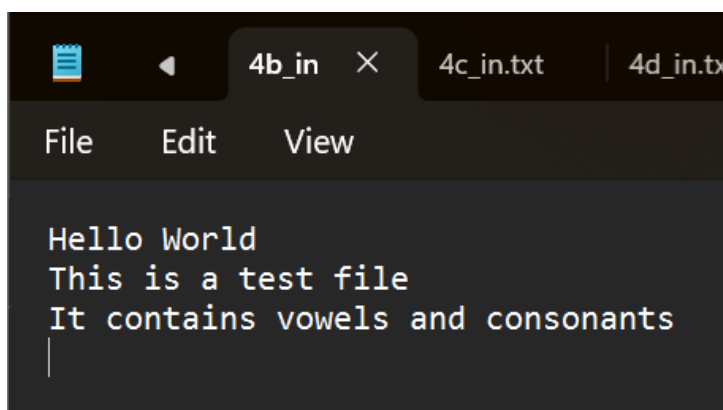

```
% {
#include<stdio.h>
int consonants = 0, vowels = 0;
% }
%%

[aeiouAEIOU] { vowels++; }
[a-zA-Z] { consonants++; }
\n
.
%%

int main() {
yyin = fopen("4b_in.txt", "r");
yylex();
printf(" This File contains...");
printf("\n\t%d vowels", vowels);
printf("\n\t%d consonants", consonants);
return 0;
}

int yywrap() {
return (1);
}
```

INPUT File:

A screenshot of a text editor window with a dark theme. The window has three tabs at the top: '4b_in' (active), '4c_in.txt', and '4d_in.txt'. The '4b_in' tab is selected, and the text inside the editor reads: 'Hello World', 'This is a test file', and 'It contains vowels and consonants'. The text is in a monospaced font, and the cursor is at the end of the third line.

```
Hello World
This is a test file
It contains vowels and consonants
|
```

OUTPUT:

```
This File contains...  
    19 vowels  
    35 consonants
```

AIM c: Write a Lex program to print out all numbers from the given file.

PROGRAM CODE:

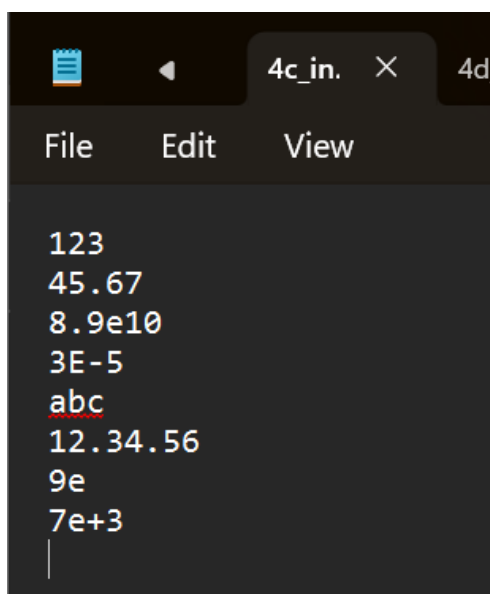

```
% {
#include<stdio.h>
% }
%%

[0-9]+(\\.[0-9]+)?([eE][+-]?[0-9]+)? {
printf("%s is a valid number \\n", yytext);
}
\\n ;
. ;
%%

int main() {
yyin = fopen("4c_in.txt", "r");
yylex();
return 0;
}

int yywrap() {
return (1);
}
```

INPUT File:

```
123
45.67
8.9e10
3E-5
abc
12.34.56
9e
7e+3
```

OUTPUT:

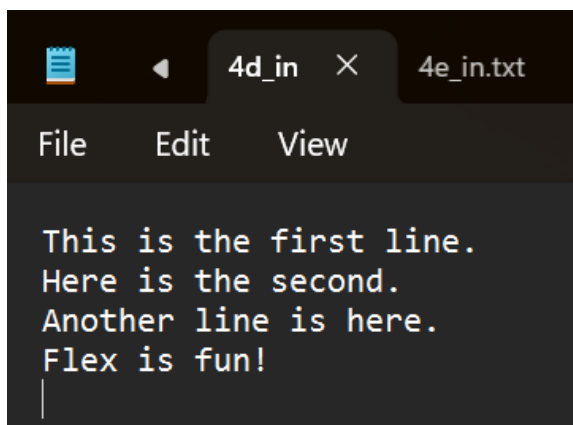

```
123 is a valid number  
45.67 is a valid number  
8.9e10 is a valid number  
3E-5 is a valid number  
12.34 is a valid number  
56 is a valid number  
9 is a valid number  
7e+3 is a valid number
```

AIM d: Write a Lex program which adds line numbers to the given file and display the same into different file.

PROGRAM CODE:

```
% {  
#include<stdio.h>  
int line_number = 1;  
% }  
%%  
.+ {  
fprintf(yyout, "%d: %s", line_number, yytext);  
line_number++;  
}  
%%  
int main() {  
yyin = fopen("4d_in.txt", "r");  
yyout = fopen("fourth_output.txt", "w");  
yylex();  
printf("done");  
return 0;  
}  
int yywrap() {  
return (1);  
}
```

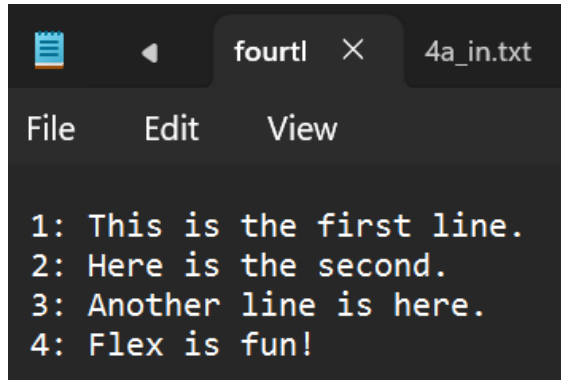

INPUT File:

```
This is the first line.  
Here is the second.  
Another line is here.  
Flex is fun!
```

OUTPUT:

done

A screenshot of a code editor window. The window has a dark theme and a menu bar with 'File', 'Edit', and 'View'. There are two tabs: 'fourtl' (active) and '4a_in.txt'. The editor displays four lines of text, each preceded by a line number:

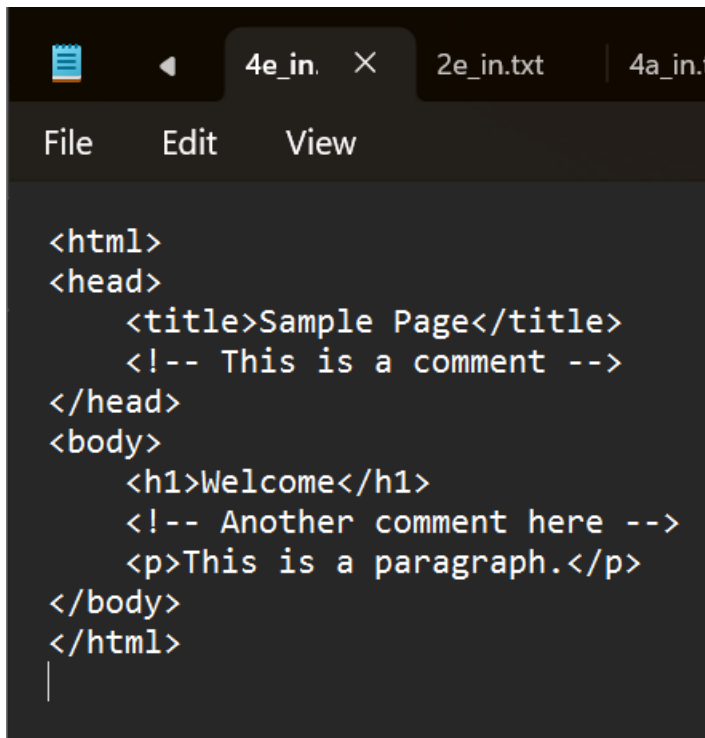

```
1: This is the first line.  
2: Here is the second.  
3: Another line is here.  
4: Flex is fun!
```

AIM e: Write a Lex program to printout all markup tags and HTML comments in file.

PROGRAM CODE:

```
% {
#include<stdio.h>
int num = 0;
% }
%%
"<"[A-Za-z0-9]+>" {
printf("%s is a valid markup tag\n", yytext);
}
"<!--"[^-->]*"-->" {
num++;
}
\n ;
. ;
%%
int main() {
yyin = fopen("4e_in.txt", "r");
yylex();
printf("Number of comments are: %d", num);
return 0;
}
int yywrap() {
return (1);
}
```

INPUT File:

A screenshot of a text editor window with a dark theme. The window has three tabs at the top: '4e_in.' (active), '2e_in.txt', and '4a_in.t'. The menu bar shows 'File', 'Edit', and 'View'. The code is as follows:

```
<html>
<head>
  <title>Sample Page</title>
  <!-- This is a comment -->
</head>
<body>
  <h1>Welcome</h1>
  <!-- Another comment here -->
  <p>This is a paragraph.</p>
</body>
</html>
```

OUTPUT:

```
<html> is a valid markup tag
<head> is a valid markup tag
<title> is a valid markup tag
<body> is a valid markup tag
<h1> is a valid markup tag
<p> is a valid markup tag
Number of comments are: 2
```

Practical – 5

AIM a: Write a Lex program to count the number of C comment lines from a given C program. Also eliminate them and copy that program into separate file.

PROGRAM CODE:

```
% {
#include<stdio.h>

int cmt = 0;

% }

%%

"//".* {
fprintf(yyout, "\n");
cmt++;
}

"/*"([^\*]|\\*+[^*/])"*"+"/" {
fprintf(yyout, "\n");
cmt++;
}

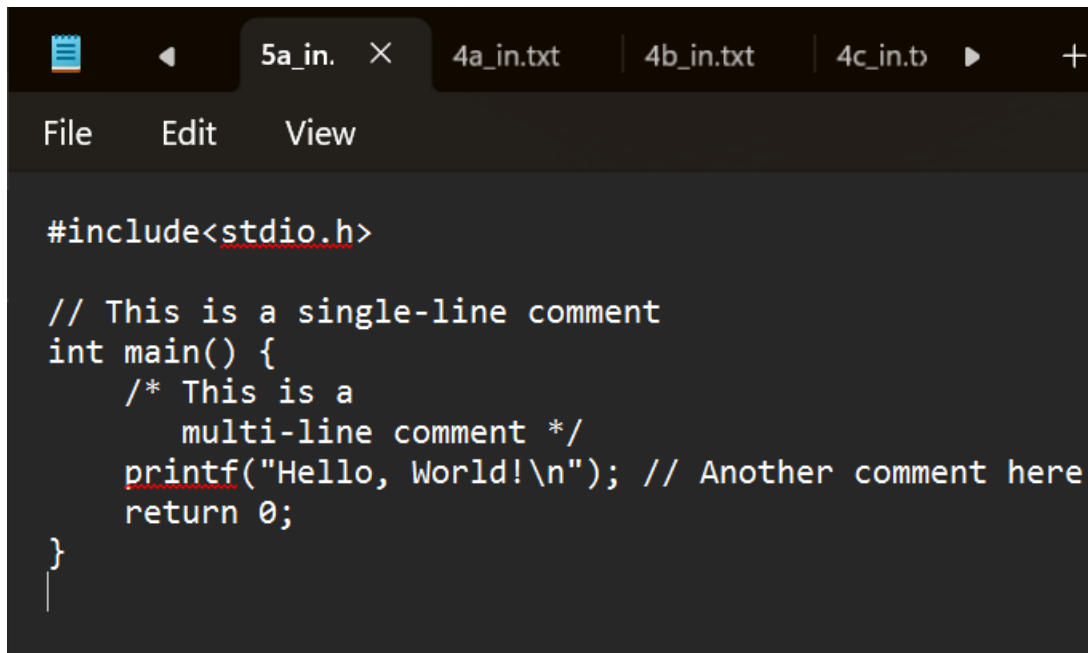

.\n {
fprintf(yyout, "%s", yytext);
}

%%

void main(){
yyin = fopen("5a_in.txt", "r");
yyout = fopen("5a_out.txt", "w");
yylex();
printf("%d Comment(s)\n", cmt);
}

int yywrap(){
return(1);
}
```

INPUT File:

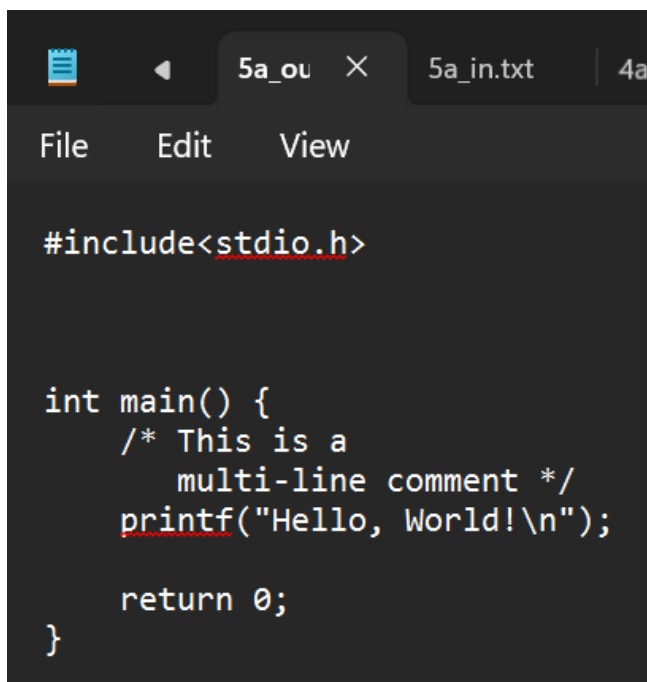

A screenshot of a code editor window with a dark theme. The title bar shows four tabs: '5a_in.' (active), '4a_in.txt', '4b_in.txt', and '4c_in.txt'. The menu bar includes 'File', 'Edit', and 'View'. The code is as follows:

```
#include<stdio.h>

// This is a single-line comment
int main() {
    /* This is a
       multi-line comment */
    printf("Hello, World!\n"); // Another comment here
    return 0;
}
```

OUTPUT:

2 Comment(s)

A screenshot of a code editor window with a dark theme. The title bar shows three tabs: '5a_ou' (active), '5a_in.txt', and '4a_in.txt'. The menu bar includes 'File', 'Edit', and 'View'. The code is as follows:

```
#include<stdio.h>

int main() {
    /* This is a
       multi-line comment */
    printf("Hello, World!\n");
    return 0;
}
```

AIM b: Write a Lex program to recognize keywords, identifiers, operators, numbers, special symbols, literals from a given C program.

PROGRAM CODE:

```
% {
#include <stdio.h>
#include <string.h>
int is_keyword(const char *str);
% }

%option noyywrap
%%

"auto"|"break"|"case"|"char"|"const"|"continue"|"default"|"do"|"double"|
"else"|"enum"|"extern"|"float"|"for"|"goto"|"if"|"inline"|"int"|"long"|
"register"|"return"|"short"|"signed"|"sizeof"|"static"|"struct"|"switch"|
"typedef"|"union"|"unsigned"|"void"|"volatile"|"while" {
printf("Keyword: %s\n", yytext);
}

[ \t\n]+ ; // Skip whitespace characters

"=="|"!="|"<="|">="|"="|"+"|"-"|"*"|"/"|"%"|"&&"|"||"|"!"|"<"|">" {
printf("Operator: %s\n", yytext);
}

[0-9]+(\\.[0-9]+)? {
printf("Number: %s\n", yytext);
}

\"([^\\"\\\\]|\\\\.)*\" {
printf("String Literal: %s\n", yytext);
}

\\'\\' {
printf("Character Literal: %s\n", yytext);
}

[{}O\\[\\],;:] {
printf("Special Symbol: %s\n", yytext);
}

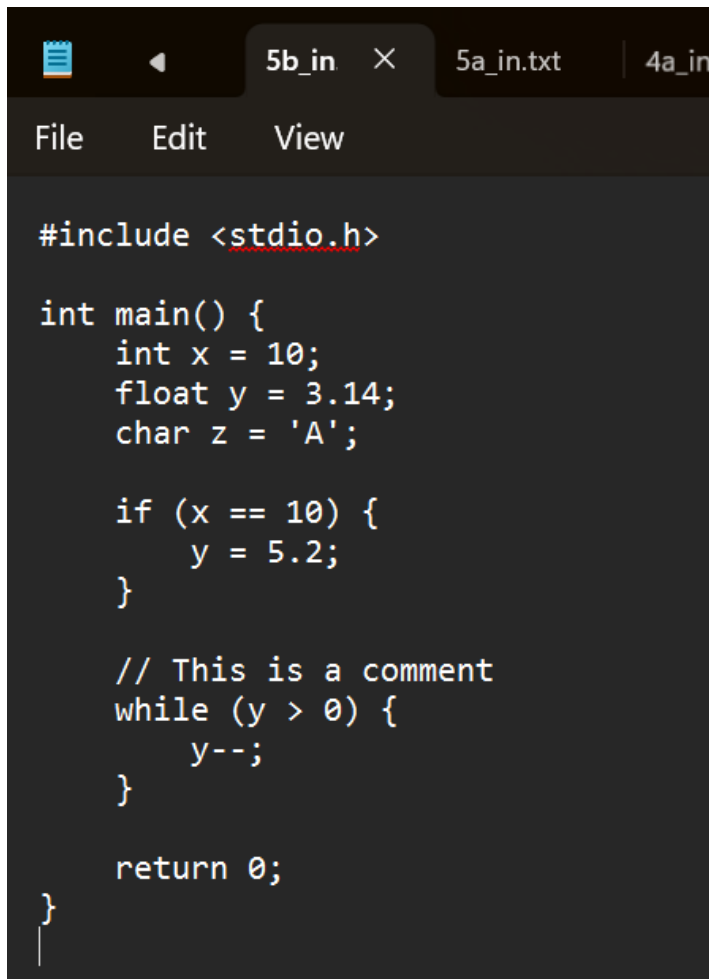

[a-zA-Z_][a-zA-Z0-9_]* {
```

```
if (is_keyword(yytext))
printf("Keyword: %s\n", yytext);
else
printf("Identifier: %s\n", yytext);
}
. {
printf("Unrecognized Character: %s\n", yytext);
}
%%

int is_keyword(const char *str) {
const char *keywords[] = {
"auto", "break", "case", "char", "const", "continue", "default", "do", "double",
"else", "enum", "extern", "float", "for", "goto", "if", "inline", "int", "long",
"register", "return", "short", "signed", "sizeof", "static", "struct", "switch",
"typedef", "union", "unsigned", "void", "volatile", "while", NULL
};
for (int i = 0; keywords[i] != NULL; i++) {
if (strcmp(keywords[i], str) == 0)
return 1;
}
return 0;
}

int main() {
yylex(); // Start lexical analysis
return 0;
}
```

INPUT File:

A screenshot of a code editor window with a dark theme. The window has three tabs at the top: '5b_in' (active), '5a_in.txt', and '4a_in'. Below the tabs is a menu bar with 'File', 'Edit', and 'View'. The main area contains C code with syntax highlighting. The code includes a header, variable declarations, an if statement, a while loop with a comment, and a return statement.

```
#include <stdio.h>

int main() {
    int x = 10;
    float y = 3.14;
    char z = 'A';

    if (x == 10) {
        y = 5.2;
    }

    // This is a comment
    while (y > 0) {
        y--;
    }

    return 0;
}
```

Practical – 6

AIM: Program to implement Recursive Descent Parsing in C.

PROGRAM CODE:

```
#include <stdio.h>
#include <stdlib.h>
char s[20];
int i = 1;
char l;
int match(char l);
int E1();
int E()
{
    if (l == 'i')
    {
        match('i');
        E1();
    }
    else
    {
        printf("Error parsing string");
        exit(1);
    }
    return 0;
}
int E1()
{
    if (l == '+')
    {
        match('+');
        match('i');
        E1();
    }
    else
```

```
{
return 0;
}
}
int match(char t)
{
if (l == t)
{
l = s[i];
i++;
}
else
{
printf("Syntax Error");
exit(1);
}
return 0;
}
void main()
{
printf("Enter the string: ");
scanf("%s", &s);
l = s[0];
E();
if (l == '$')
{
printf("parsing successful");
}
else
{
printf("Error while parsing the string\n");
}
}
```

OUTPUT:

```
Enter the string: i+i+i$  
parsing successful  
D:\NUV\CD\LAB>
```

Practical – 7

AIM a: To Study about Yet Another Compiler-Compiler(YACC).

What is YACC?

YACC (Yet Another Compiler-Compiler) is a tool used to generate parsers, which are part of the syntax analysis phase of a compiler. It takes a formal grammar (usually written in BNF-like syntax) and produces C code that can parse input sequences according to that grammar.

- Developed by Stephen C. Johnson in the 1970s at Bell Labs.
- Works closely with LEX/Flex, which handles lexical analysis (tokenization).
- YACC focuses on syntax parsing (checking structure of token sequences).

Components of YACC

A YACC program consists of three sections, just like LEX:

```
% {  
// C declarations  
% }  
%%  
// Grammar rules with actions  
%%  
// Supporting C code (like main)
```

How YACC Works

1. Input: A context-free grammar (CFG) with actions (usually in C).
2. Output: A parser in C that uses LALR(1) parsing (Look-Ahead LR).
3. Integration: Uses token definitions from LEX (via `yylex()`).
Executes specific C actions when grammar rules match.

Key Features

| Feature | Description |
|-----------------|-------------------------------|
| Grammar Type | Context-Free Grammar |
| Parsing Method | LALR(1) Parser (Bottom-Up) |
| Integration | Works with LEX/Flex |
| Output | C code (y.tab.c) |
| Action Language | C (executed when rules match) |

Use Cases

- Building compilers/interpreters
- Scripting languages
- Code validators or analyzers
- Structured data parsers (e.g., config files, DSLs)

AIM b: Create Yacc and Lex specification files to recognizes arithmetic expressions involving +, -, * and /.

PROGRAM CODE:

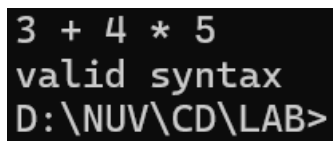

.l file

```
% {  
#include <stdlib.h>  
void yyerror(char *);  
#include "7b.tab.h"  
% }  
%%  
[0-9]+ { yylval = atoi(yytext); return NUM; }  
[a-zA-Z_][a-zA-Z_0-9]* { return id; }  
[-+*\n] { return *yytext; }  
[ \t] { }  
. yyerror("invalid character");  
%%  
int yywrap() {  
return 0;  
}
```

.y file

```
% {  
#include <stdio.h>  
int yylex(void);  
void yyerror(char *);  
% }  
%token NUM  
%token id  
%%  
S: E '\n' {  
printf("valid syntax");  
return(0);  
}  
E: E '+' T { }
```

```
| E ' ' T { }  
| T { }  
T: T '*' F { }  
| F { }  
F: NUM { }  
| id { }  
%%  
void yyerror(char *s) {  
    fprintf(stderr, "%s\n", s);  
}  
int main() {  
    yyparse();  
    return 0;  
}
```

OUTPUT:

```
3 + 4 * 5  
valid syntax  
D:\NUV\CD\LAB>
```

AIM c: Create Yacc and Lex specification files are used to generate a calculator which accepts integer type arguments.

PROGRAM CODE:

.l file

```
% {  
#include <stdlib.h>  
void yyerror(char *);  
#include "7c.tab.h"  
% }  
%%  
[0-9]+ { yylval = atoi(yytext); return NUM; }  
[-+*\n] { return *yytext; }  
[ \t] { }  
. { yyerror("invalid character"); }  
%%  
int yywrap() {  
return 0;  
}
```

.y file

```
% {  
#include <stdio.h>  
int yylex(void);  
void yyerror(char *);  
% }  
%token NUM  
%%  
S: E '\n' { printf("%d\n", $1); return(0); }  
E: E '+' T { $$ = $1 + $3; }  
| E '-' T { $$ = $1 - $3; }  
| T { $$ = $1; }  
T: T '*' F { $$ = $1 * $3; }  
| F { $$ = $1; }  
F: NUM { $$ = $1; }
```

```
%%  
void yyerror(char *s) {  
    fprintf(stderr, "%s\n", s);  
}  
int main() {  
    yyparse();  
    return 0;  
}
```

OUTPUT:

4*4
16

AIM d: Create Yacc and Lex specification files are used to convert infix expression.

PROGRAM CODE:

.l file

```
% {  
#include<stdio.h>  
#include "7d.tab.h"  
void yyerror(char *);  
% }  
%%  
[0-9]+ { yylval.num = atoi(yytext); return INTEGER; }  
[A-Za-z_][A-Za-z0-9_]* { yylval.str = yytext; return ID; }  
[-+;\n*] { return *yytext; }  
[ \t] ;  
. yyerror("invalid character");  
%%  
int yywrap() {  
return 1;  
}
```

.y file

```
% {  
#include<stdio.h>  
int yylex(void);  
void yyerror(char *);  
% }  
%union {  
char *str;  
int num;  
}  
%token <num> INTEGER  
%token <str> ID  
%%  
S: E '\n' { printf("\n"); }
```

```
E: E '+' T { printf("+ "); }
| E '-' T { printf("- "); }
| T { }
T: T '*' F { printf("* "); }
| F { }
F: INTEGER { printf("%d ", $1); }
| ID { printf("%s ", $1); }
%%
void yyerror(char *s) {
printf("%s\n", s);
}
int main() {
yyparse();
return 0;
}
```

OUTPUT:

```
56+43-55*31
56 43 + 55 31 * -
```
